Art Unit: 2116

DETAILED ACTION

- 1. This Office Action is in response to Amendment filed on February 4, 2004 (Paper No. 5).
- 2. Claims 15 and 16 are added.
- 3. Claims 1-16 are presented for examination.
- 4. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 103

- 5. Claims 1-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gibson et al. [Gibson] (U.S. Patent No. 6,601,167).
- Regarding claim 1, Gibson teaches a computer system comprising:
 initialization memory (sequential access memory 32) containing initialization code [col.
 lines 30-34; col. 13, line 26];

a processor (14) coupled to said initialization memory [Fig. 1] for executing said initialization code [col. 4, lines 8-21]; and

a memory (32) coupled to said processor and used to store variables used by the processor while executing said initialization code [col. 3, lines 52-59; col. 4, lines 8-21].

Gibson does not explicitly teach the memory used to store variables used by the processor is a SRAM. However, SRAM is a volatile memory and Gibson teaches that only volatile memory is used in this purpose. Therefore. One of ordinary skill in the art would have recognized that SRAM could be used in place of the memory taught by Gibson.

Application/Control Number: 09/751,788

Art Unit: 2116

Furthermore, Gibson does not explicitly disclose two separate memories, one for storing initialization code and the other for storing variables used by the processor. However, Gibson mentions that conventional system used a ROM for storing initialization code and used the sequential access memory for storing variables used by the processor [col. 1, line 17 et seq.]. Therefore, one of ordinary skill in the art would have readily recognized that using two separate memories (ROM and SRAM) is possible and applicable in Gibson's system.

- 7. Regarding claims 2 and 3, Gibson teaches that the memory is assigned addresses overlaying a portion of the addresses assigned to the initialization memory [col. 4, line 22 et seq.].
- 8. Regarding claims 4 and 5, Gibson teaches that the system including a DRAM (RAM 16) coupled to the processor for the processor to use when executing application code [Fig. 1].

Gibson does not explicitly specify the initialization code is for initializing said DRAM.

One of ordinary skill in the art would have readily recognized that the initialization code used for initializing DRAM is part of BIOS code. Therefore, it would have been obvious to use Gibson's memory (SRAM) to load only DRAM's initialization code for initializing DRAM at system startup, then load subsequence codes into RAM for execution thereafter [col. 5, lines 58-62].

9. Regarding claims 6-16, Gibson teaches the claimed method steps. Therefore, Gibson teaches the apparatus to implement the claimed method steps.

Conclusion

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Thuan N. Du whose telephone number is (703) 308-6292. The examiner can normally be reached on Monday-Friday: 9:00 AM - 5:30 PM, EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas C. Lee can be reached on (703) 305-9717.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.

The fax number for the organization is (703) 872-9306.

Thuan N. Du
